SciencePoles, an International Polar Foundation outreach initiative dedicated to bringing Arctic and Antarctic science to a wider audience, has been relaunched with a new focus, look and feel.

The popular SciencePoles website will continue to concentrate on delivering original interviews and articles on cutting edge polar science, with news on research findings and event updates. The new responsive website is designed for smartphones and tablets, making it even easier to catch up on polar news while on the move.

SciencePoles features interviews with leading polar scientists, along with articles on the important natural and social science research taking place in both the Arctic and Antarctica. Scientific research in the Earth's polar regions is essential to developing understanding of our planet, its history, regional ecosystems, and the workings of the global climate system.
